                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SOURCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (http://www.jac.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repeated with T4 DNA polymerase and T4 polynuclectide kinase. Adaptor ollgonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWN42 (gil432114 [go]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicilin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymenase and T4 polymorlectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored but was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pw042 (gild/32114 [gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coll XI10-Gold (Stratagene) cells and selected complementary complementary complementary or the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically competent E. coll XI10-Gold (Stratagene) cells and selected campicillin resistance."

Laboratory mouse DAN accounted definitions of the private Jay and the properties of the private Jay mouse Jay according to the provided definition of the properties of the sheared DAN was blunt end-repaired with T4 DAN polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar access. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative aganose gel electrophoresis. Vector DNA was prepared from a derivative of pwhol2 (gila/32114 lgb)AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Unpublished (2000)

proteins KCNQ2 and KCNQ3. Detecting mutations in sequences that encode KCNQ2 or KCNQ3, or KCNQ3, or the loss of one copy of these genes, is used for diagnosis and prognosis of benign familial neonatal epilepsy (BENE), juvenile myotonic epilepsy (JME) or rolandic epilepsy (RE). Cells (or transspenic animals) that express wild-type or mutant KCNQ2 or 3 (also the proteins themselves in cell-free form) are used to screen for agents that can be used to treat or prevent these forms of epilepsy. Fragments of the encoding nucleic acids are used as probes or primers, either for detecting mutations or for isolation of related sequences, while the complete sequences may be used in gene therapy to provide wild-type proteins are used as diagnostic reagents and for drug screening. The KCNQ2 and 3 proteins are useful in rational design of drugs and therapeutically (in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       replacement theraples). The forms of epilepsy associated with mutations in KCNQ2 and 3 sequences can now be diagnosed early (before symptoms are manifest), and better treatment options will be available.
                                                                                                              This invention describes novel human and mouse potassium channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAX57074-X57139 are primers used in the method of the invention.
Nucleic acid encoding potassium channels KCNQ2 and 3

CC KCNQ2 or KCNQ3, or the loss of one copy of these genes, is used for diagnosis and prognosis of benign familial neonatal epilepsy (BRDE).

CC diagnosis and prognosis of benign familial neonatal epilepsy (BRDE).

CC transgenic animals) that express wild-type or mutant KCNQ2 or 3 (also the rangeauic animals) that express wild-type or mutant KCNQ2 or 3 (also the proteins themselves in cell-free form) are used to screen for agents that can be used to treat or prevent these forms of epilepsy. Fragments of the encoding mutations or for isolation of related sequences, while the complete sequences may be used in gene therapy to provide wild-type protein. Antibodies specific for mutant or wild-type proteins are used as diagnostic reagents and for drugs sand therapeutically (in replacement therapies). The forms of epilepsy associated with mutations in KCNQ2 and 3 sequences can now be diagnosed early (before symptoms are manifest), and better treatment options will be available.

AAX57074-X57139 are primers used in the method of the invention.

                                                                                                                                                                                                                                   ö
                               A DNA segment with a nucleotide sequence from about 130 to about 918 of the sequence given here is claimed. Also claimed are antibodies which immunoraect with hurrH and the claimed peptides (given in AAP80713). The antibodies may be used in immunoassays for detection of hurrH. The claimed peptides may be used to inhibit the binding of hurr to coagulation factor VII/VIIa in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A DNA segment with a nucleotide sequence from about 130 to about 918 of the sequence given here is claimed. Also claimed are antibodies which immunoreact with hurFH and the claimed peptides (given in AAP80713). The antibodies may be used in immunoassays for detection of hurFH. The claimed peptides may be used to inhibit the binding of hurF to coagulation factor VII/VIIa in vivo.

Polynucleotides encoding such analogs are incorporated into pEZZ318.thy2 and expressed in Escherichia coll RV308 (ATCC 31608).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein inhibitors of serine proteinase(s), e.g. furin, derly. from turkey ovomucoid third domain - used as laboratory reagents to study the proteinase(s), or as chemotherapeutic agents treat diseases associated with them

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     In synthetic analogs of turkey ovomucoid domain protein (6-56) (OWTKY3), given in AAR69818-24, the region immediately adjacent to the reactive site peptide bond is mutated to include the consensus sequence of furin or other serine protease. Polynucleotides encoding such analogs are incorporated into pEZZ318.thy2 and expressed in Escherichia coli RV308 (ArCC 31608).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein inhibitors of serine proteinase(s), e.g. furin, deriv. from turkey ovomucoid third domain - used as laboratory reagents to study the proteinase(s), or as chemotherapeutic agents to treat diseases associated with them
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0;

These and other antisense oligonucleotides (AAT33327-36) complementary to specific regions of the CAPL gene (see also AAT3335), as well as CAPL-specific ribozymes (AAT33337-40) can be administered to a patient as a means of inhibiting metastatic cancer.
                                                                                                                                         Engebraaten O, Fodstad O, Hovig E, Maelandsmo GJ;

genes of the present invention.

ខ្ល

```
The present invention relates to human and murine cDNAs from a neurosessory defect associated gene family. The novel cDNAs are mouse tub form I (see AAA94630), human TUB form I (see AAA94631), human TUB form 6 (see AAA94632), human TULP2 (see AAA94633), 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mammalian proteins expressed in retina and brain, useful for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cochlear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps
Novel antisense oligonucleotides capable of inhibiting CAPL gene expression may include the trinucleotide dGOC (ART33326, given in 5' to 3' direction) found in codon 14 of CAPL mRNs. These and other antisense oligonucleotides (AAT3337-36) complementary to specific regions of the CAPL gene (see also AAT3335), as well as CAPL-specific ribozymes (AAT3337-40) can be administered to a patient as a means of inhibiting metastatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; TULP; neurosensory defect; retina; retinal dystrophy; probe;

The invention relates to human breast cancer expressed polynucleotides AAALOSO99) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide useful as a marker for the diagnosis of breast cancer

The sequences given in AAQ81642-95 are oligonucleotides which modulate the activity of basic fibroblast growth factor (bFGF) by binding to the bEFE protein. Most easp, the sequences given in AAQ81664-67 represent core sequences of which at least one is present in each of the binding oligos. These oligonucleotides may form a single strand, as trand, a stem-loop structure, a bubble structure, a pseudoknot or a closed, circular structure. bFGF binds to high affinity receptor and low affinity heparin-like molecules on the cell surface. These oligonucleotides bind to bFGF in competition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cell surface. These oligonucleotides bind to bFGF in competition with its receptor and heparin. These oligonucleotides may inhibit one enhance the activity of bFGF. Particularly, they inhibit neovascularisation so they can be used to suppress growth of solid tumours and to reduce the risk of metastasis. They can be used as diagnostic reagents to determine the presence of thrombin, or used in
                                                                                                                                                               New oligo-nucleotide(s) that bind to basic fibroblast growth factor - modulating, esp. inhibiting, its activity, useful in treating cancer, preventing metastasis, and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Basic; fibroblast growth factor; bFGF; stem-loop structure; bubble structure; pseudoknot; receptor; heparin; competition; inhibition; enhance; neovascularisation; solid tumour; cancer; metastasis; diagnosis; gene therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAQB1642-95 are oligonuclectides which modulate the activity of basic fibrobiast growth factor (bFGF) by binding to the bFGF protein. Wost esp. the sequences given in AAQB1664-67 represent core sequences of which at least one is present in each of represent core sequences of which at least one is present in each of the binding oligos. These oligonuclectides may form a single the binding oligos. These oligonuclectides may form a single strand, double strand, a stem-loop structure, a bubble structure, a pseudoknot or a closed, circular structure. BFGF binds to high a finity receptor and low affinity heparin-like molecules on the call surface. These oligonuclectides bind to bFGF in competition with its receptor and heparin. These oligonuclectides may inhibit neovascularisation so they can be used to suppress growth of solid tumours and to reduce the risk of metastasis. They can be used as a diagonal content of the presence of thrombin, or used in

RESULT 14

07-JAN-1994; 18-JUN-1993;

The sequences given in AAQB1642-95 are oligonucleotides which modulate the activity of basic fibrobiast growth factor (bFGF) by binding to the bFGF protein. Wost esp. the sequences given in AAQB1664-67 represent core sequences of which at least one is present in each of the binding oligos. These oligonucleotides may form a single strand, double strand, a stem-loop structure, a bubble structure, a pseudoknot or a closed, circular structure. BFGF binds to high a pseudoknot or a closed, circular structure. BFGF binds to high a pseudoknot and low affinity heparin-like molecules on the cell structure and low affinity heparin-like molecules on the with its receptor and heparin. These oligonucleotides may inhibit or enhance the activity of bFGF. Particularly, they inhibit concascularisation so they can be used to suppress growth of solid tumours and to reduce the risk of metastasis. They can be used as the concascularisation to determine the presence of thrombin, or used in New oligo-nucleotide(s) that bind to basic fibroblast growth factor - modulating, esp. inhibiting, its activity, useful in treating cancer, preventing metastasis, and diagnosis. Claim 3; Page 25; 44pp; English. gene therapy.
